## **Survey of Avifauna in the Jajerud and Damavand basin, South of the Alborz Mountains**

PARVIZ BAKHTIARI & MOHAMMAD TOHIDIFAR\*

*Biodiversity & Habitats Division, Department of Environment, Science & Research Unit, Islamic Azad  
University, Tehran*

\* Correspondence Author. Email: mohammad\_8463@yahoo.com

*Received 15 January 2006; accepted 16 May 2007*

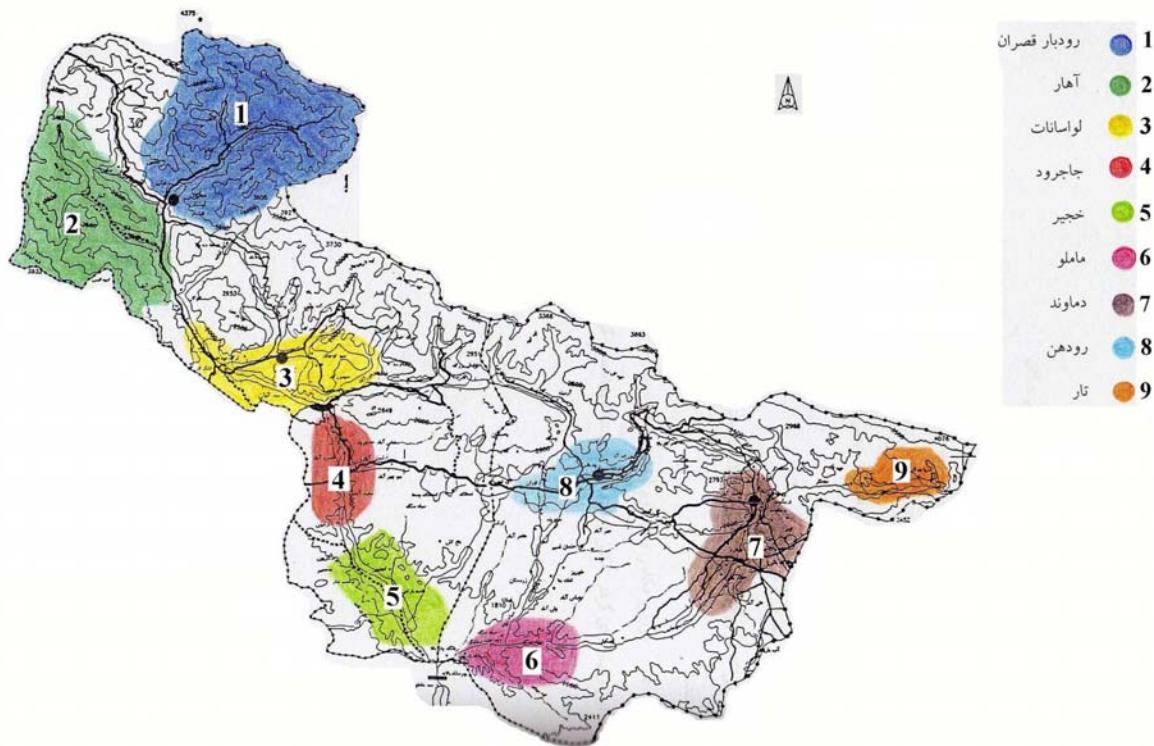

**Abstract:** The Jajerud and Damavand basin extends to the southern Alborz heights in the north and the Varamin plain in the south. This basin has established ranges of fauna and flora types because it possesses considerable altitudinal variation encompassing many biotas. In this survey, the basin was divided into ten sub-basins that covered all the biotas therein. 173 bird species were identified visually using binoculars and from capture using mist nets, hand nets and a projector. 35 of these species are protected by the Iranian Environmental Laws. Among the families, the most numerous was Turdidae, with 21 species. Of the ten sub-basins Khojir (88 species) and Jajerud (71 species) held the highest species totals, while the Tar had the lowest (21 species).

**Keywords:** Avifauna, Jajerud, Khojir, Damavand, Basin, Tehran province.
